```
## The following objects are masked from 'package:stats':
```

```
##
```

```
##      cov, smooth, var
```

```
library(MASS) # LDA
```

```
##
```

```
## Attaching package: 'MASS'
```

```
## The following object is masked from 'package:dplyr':
```

```
##
```

```
##      select
```

```
##(a)
```

```
# Import data
```

```
data(Weekly)
```

```
weekly <-
```

```
  Weekly %>%
```

```
  dplyr::select(-Today)
```

```
# Feature plots
```

```
theme1 <- transparentTheme(trans = .4)
```

```
trellis.par.set(theme1)
```

```
featurePlot(x = weekly[, 1:7],
```

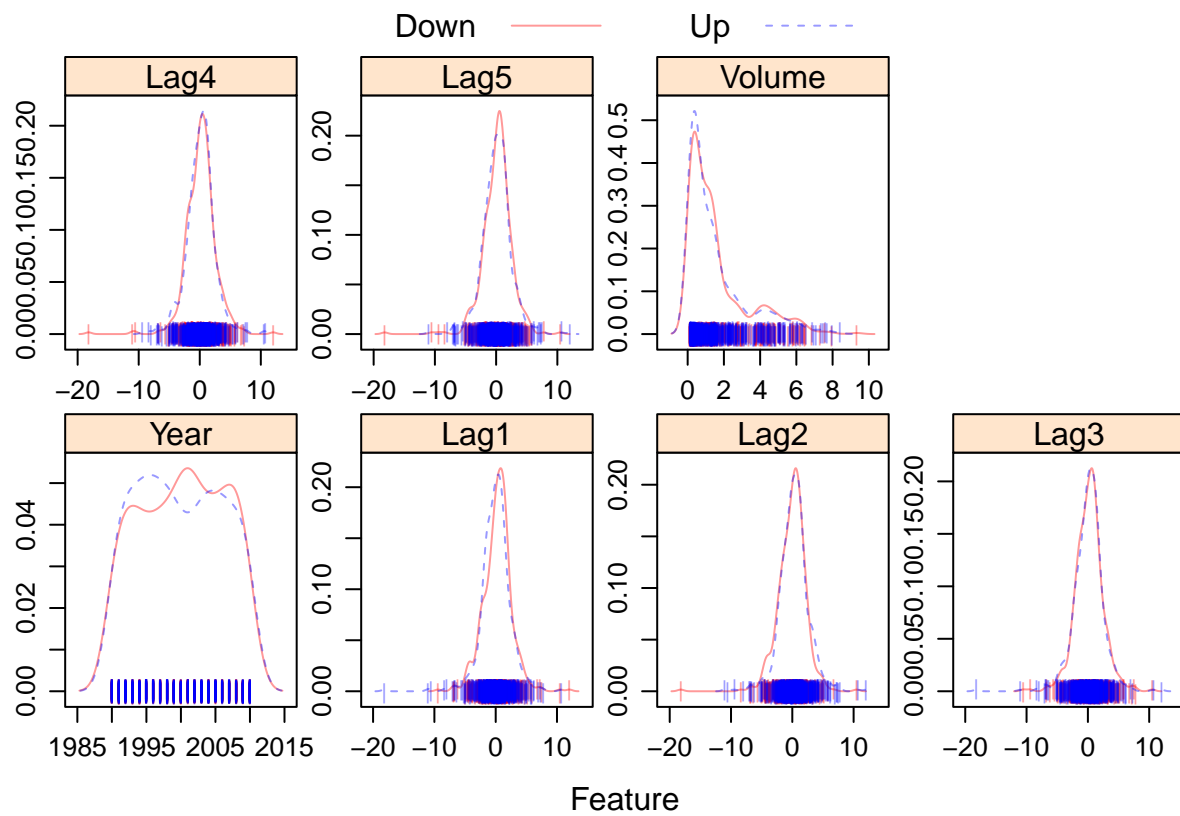

```
            y = weekly$Direction,
```

```
            scales = list(x = list(relation = "free"),
```

```
                           y = list(relation = "free")),
```

```
            plot = "density", pch = "|",
```

```
            auto.key = list(columns = 2))
```

```
# Correlation plot
corrplot(cor(weekly[, -8]), tl.srt = 45, order = 'hclust', type = 'upper')
```

The feature plots show that the distribution of the response classes (Up or Down) highly overlap for each feature. The correlation plot shows that there is not much pairwise correlation between the features.

```

It seems that the Lag1 predictor is statistically significant.

```

#compute the confusion matrix and overall fraction of correct predictions using the test data
test.pred.prob <- predict(glm_train, newdata = test_df,
                          type = "response")

test.pred <- rep("Down", length(test.pred.prob))
test.pred[test.pred.prob>0.5] <- "Up"

confusionMatrix(data = as.factor(test.pred),
                 reference = test_df$Direction,
                 positive = "Up")

## Confusion Matrix and Statistics
##
##              Reference
## Prediction Down Up

```

```
##      Down   31 44
##      Up     12 17
##
##              Accuracy : 0.4615
##              95% CI : (0.3633, 0.562)
##      No Information Rate : 0.5865
##      P-Value [Acc > NIR] : 0.9962
##
##              Kappa : -3e-04
##
##      McNemar's Test P-Value : 3.435e-05
##
##              Sensitivity : 0.2787
##              Specificity : 0.7209
##              Pos Pred Value : 0.5862
##              Neg Pred Value : 0.4133
##              Prevalence : 0.5865
##              Detection Rate : 0.1635
##      Detection Prevalence : 0.2788
##              Balanced Accuracy : 0.4998
##
##      'Positive' Class : Up
##
```

The confusion matrix indicates that the fraction of correct classification is 0.4615. Because the No Information Rate value (0.5865) is higher than the Accuracy value, it would be hard to conclude that the classification is entirely valid. The large P-value also indicates that the accuracy is not significantly better than the No Information Rate. In addition, the Kappa Value that is close to 0 indicates that the classification performance is not good. The sensitivity (0.2787) is low while the specificity (0.7209) is relatively high.

(c)

```
glm_train2 <- glm(Direction ~ Lag1 + Lag2,
                  data = train_df,
                  family = binomial(link = "logit"))

test.pred.prob <- predict(glm_train2, newdata = test_df,
                          type = "response")
test.pred <- rep("neg", length(test.pred.prob))
test.pred[test.pred.prob>0.5] <- "pos"

roc.glm <- roc(test_df$Direction, test.pred.prob)

## Setting levels: control = Down, case = Up

## Setting direction: controls < cases

plot(roc.glm, legacy.axes = TRUE, print.auc = TRUE)
plot(smooth(roc.glm), col = 4, add = TRUE)
```

AUC is 0.518.

The

(d)

```
# LDA
lda.fit <- lda(Direction~ Lag1 + Lag2,
               data = train_df)
lda.pred <- predict(lda.fit, newdata = test_df)
roc.lda <- roc(test_df$Direction, lda.pred$posterior[,2])
```

```
## Setting levels: control = Down, case = Up
```

```
## Setting direction: controls < cases
```

```
plot(roc.lda, legacy.axes = TRUE, print.auc = TRUE)
```

```
# QDA
qda.fit <- qda(Direction ~ Lag1 + Lag2,
               data = train_df)
qda.pred <- predict(qda.fit, newdata = test_df)
roc.qda <- roc(test_df$Direction, qda.pred$posterior[,2])
```

```
## Setting levels: control = Down, case = Up
```

```
## Setting direction: controls > cases
```

```
plot(roc.qda, legacy.axes = TRUE, print.auc = TRUE)
```

```
auc <- c(roc.lda$auc[1], roc.qda$auc[1])
```

The AUC from LDA is 0.55661 and the AUC from QDA is 0.5288.

(e)

```
ctrl <- trainControl(method = "repeatedcv",
                     repeats = 5,
                     summaryFunction = twoClassSummary,
                     classProbs = TRUE)

model.knn <- train(x = train_df[,1:2],
                  y = train_df$Direction,
                  method = "knn",
                  preProcess = c("center", "scale"),
                  tuneGrid = data.frame(k = seq(1, 499, by = 5)),
                  trControl = ctrl)
```

```
## Warning in train.default(x = train_df[, 1:2], y = train_df$Direction, method
## = "knn", : The metric "Accuracy" was not in the result set. ROC will be used
## instead.
```

```
model.knn$bestTune
```

```
##      k
## 99 491
```

```
pred_knn = predict.train(model.knn, newdata = test_df, type = 'prob')
roc_knn <- roc(test_df$Direction, pred_knn[,2])
```

```
## Setting levels: control = Down, case = Up
```

```
## Setting direction: controls < cases
```

```
plot.roc(roc_knn, legacy.axes = TRUE, print.auc = TRUE)
```

Discuss Results: I have trained models using the data from 1990 to 2008 and predicted 'Direction' from 2009 to 2010. I can see that LDA has the largest AUC, which indicates that it predicts the best. However, it is also apparent that the AUC for the 4 models are similar and slightly above 0.5, which indicates that the response 'Direction' is hard to be correctly classified with the given predictors. In addition, the AUC for logistic regression, LDA, and QDA are stable since they do not involve tuning parameters. On the other hand, the KNN method is not stable.
